

IVIVE Simulation Examples

Kristen Windoloski

March 13, 2025

If you have not already read the *Introduction to the ToCS App* vignette, it is highly recommended to do so to get a general idea of the app's layout and obtain a detailed description of common user inputs across all output modules. Users should also review the README file on the ToCS GitHub page (github.com/KristenWindoloski/ToCS) to setup ToCS if they have not accessed the app yet. This vignette assumes that you have access the ToCS app GUI already.

Introduction

This vignette provides three examples that use the ToCS app to generate oral equivalent doses (OEDs) by in vitro in vivo extrapolation (IVIVE), each example with different parameters selected. Two of the three examples also incorporate chemical exposure data to generate bioactivity exposure ratios for chemical prioritization. To begin, open the app by using any of the methods described in the README file. You have correctly accessed the app if your screen looks like the image below.

The screenshot displays the opening interface of the Toxicokinetic Chemical Simulator (ToCS) app. The interface features a top navigation bar with the following tabs: "Toxicokinetic Chemical Simulator (ToCS)", "General Parameters", "Model Specifications", "Compound Selection", "Advanced (Optional) Parameters", and "Run Simulation". The "General Parameters" tab is currently selected and highlighted.

The main content area is divided into three vertical panels:

- INSTRUCTIONS:** This panel contains text explaining the app's purpose and providing instructions on how to use the tabs. It also lists the four toxicokinetic (TK) outputs: 1) Concentration-time profiles, 2) Steady state (SS) concentrations, 3) In vitro in vivo extrapolation (IVIVE), and 4) Parameter calculations. It mentions that the app uses the U.S. EPA's R package 'httk' and provides links for more information and reporting issues.
- OUTPUT:** This panel has a heading "Select the desired output." followed by a dropdown menu with the text "Select". Below the dropdown, a red error message states "Must not be equal to Select."
- SPECIES:** This panel has a heading "Select the species to analyze." followed by a dropdown menu with the text "Select". Below the dropdown, a red error message states "Must not be equal to Select."

The opening interface to the ToCS app.

Example 1

Let's say we want to perform IVIVE for eight chemicals that we have bioactivity data for. Since the IVIVE produces an OED for each bioactive concentration, assume that we want to transform the nominal bioactivity data to a free concentration in vitro. When the solution is outputted, we want the 5th dose quantile human plasma OED calculated from the pbtk model. Assume that we also have chemical exposure estimates for all eight chemicals.

General Parameters Tab

Since we want to perform IVIVE, we select the *In vitro in vivo extrapolation (IVIVE)* option under the drop down menu from the *Output* card. Then under the *Species* card, we select *Human* for the first drop down. Thus, the completed *General Parameters* tab should look like the image below.

The screenshot shows the 'General Parameters' tab of the 'Toxicokinetic Chemical Simulator (ToCS)'. The interface has a top navigation bar with tabs: 'General Parameters' (active), 'Model Specifications', 'Compound Selection', 'Advanced (Optional) Parameters', and 'Run Simulation'. The main content area is divided into three panels:

- INSTRUCTIONS:** Contains text explaining the four toxicokinetic (TK) outputs: 1) Concentration-time profiles, 2) Steady state (SS) concentrations, 3) In vitro in vivo extrapolation (IVIVE), and 4) Parameter calculations. It also mentions the application uses the U.S. EPA's R package 'httk' and provides links for more information and guidance.
- OUTPUT:** Features a label 'Select the desired output.' and a dropdown menu currently set to 'In vitro in vivo extrapolation (IVIVE)'.
- SPECIES:** Features a label 'Select the species to analyze.' and a dropdown menu currently set to 'Human'.

The completed General Parameters tab for example 1.

Model Specifications Tab

Under the *Dosing* card, we see that there are no user specifications to be made for this module. However, there are several user choices to be made under the *Model* card. Since we want to use the pbtk model for IVIVE, we select *pbtk* for the first drop down. For the second drop down we select *No* and decide to not make compounds with only in silico generated parameters available for this example.

Then, the third drop down menu asks the user whether they want to return a single OED per compound (a selected quantile) or all OED samples per compound. Since we only want the 5th OED quantile (95th steady state concentration quantile), we select *Only return a specified dose quantile (default)*. This prompts the

appearance of an additional numeric input box where we want to enter the desired steady state concentration quantile. Since we want the 95th steady state concentration quantile (5th OED quantile), we leave the input as 0.95. Thus, the completed *Model Specifications* tab should look like the two images below.

The screenshot shows the 'Model Specifications' tab of the Toxicokinetic Chemical Simulator (ToCS). The interface has a top navigation bar with tabs: 'General Parameters', 'Model Specifications' (active), 'Compound Selection', 'Advanced (Optional) Parameters', and 'Run Simulation'. The main content area is divided into two panels. The left panel, titled 'DOSING', contains the text 'No options for this category.' The right panel, titled 'MODEL', contains several configuration options: 1. A dropdown menu for 'Select the model to simulate. If a species other than 'Human' is selected, '3compartmentss' must be chosen.' with 'pbtk' selected. 2. A dropdown menu for 'Select whether to use in silico generated parameters for compounds with missing in vitro data. These parameters will not overwrite existing in vitro data, and it will expand the number of compounds available.' with 'No, do not load in silico parameters' selected. 3. A dropdown menu for 'Select whether to return all oral equivalent dose (OED) samples for each compound or a selected quantile.' with 'Only return a specified dose quantile (default)' selected. 4. A text input field for 'Enter the steady state concentration quantile (as a decimal) to be used in the OED calculation. Selecting the 95th concentration quantile will output the 5th OED quantile.' with the value '0.95' entered.

The completed model specifications tab for example 1 showing the model card.

Compound Selection Tab

Different from the other modules and vignettes, the first drop down menu under the *Preloaded Compounds* card has the user select a set of assumptions to implement regarding in vitro and in vivo bioactivity as well as metabolic clearance. The user can select from the following options:

- NULL:
 - Default assumptions applied (listed below) or customizable in the Advanced Parameters tab
 - Restrictive metabolic clearance (protein binding taken into account in liver clearance)
 - Treats the total specified concentration or tissue as bioactive in vivo
 - Treats the nominal concentration in vitro as bioactive
- Honda1:
 - Restrictive metabolic clearance (protein binding taken into account in liver clearance)
 - Treats the unbound (free) venous plasma concentration in vivo as bioactive
 - Treats the unbound (free) concentration in vitro as bioactive
- Honda2:
 - Restrictive metabolic clearance (protein binding taken into account in liver clearance)
 - Treats the unbound (free) venous plasma concentration in vivo as bioactive
 - Treats the nominal concentration in vitro as bioactive
- Honda3:
 - Restrictive metabolic clearance (protein binding taken into account in liver clearance)
 - Treats the total venous plasma concentration in vivo as bioactive

- Treats the nominal concentration in vitro as bioactive
- Honda4:
 - Non-restrictive metabolic clearance (protein binding not taken into account in liver clearance)
 - Treats the total specified tissue concentration in vivo as bioactive
 - Treats the nominal concentration in vitro as bioactive

For more details, see the EPA's htk documentation and/or the following publication <https://doi.org/10.1371/journal.pone.0217564>. Since we want to use the unbound (free) concentration in vitro as bioactive instead of the nominal concentration, we select the *Honda1* assumption for the first drop down menu. We then keep the second drop menu in the *Preloaded Compounds* card on *Choose from all available chemicals*. Then, the box below asks for the user to specify the fraction fetal bovine serum. We apply the assumption that it is 0.1 for the bioactivity assays for our desired compounds and leave the box at 0.1. Another box below also appears and contains a list of preloaded compounds that we can select from. We search for the eight compounds that we would like to simulate and see that they are all present in the preloaded list. Thus, we select those compounds. On the *Uploaded Data* card on the right of the interface, there are three datasets that can be uploaded. The first one is if we need to upload any physical-chemical data for compounds we want to simulate that are not available under the preloaded compounds list. However, we do not need to upload anything here because all of the compounds we wanted were already available. The second spot to upload a file is required for IVIVE simulations. Here, we must upload a CSV file with bioactive concentrations (uM units) for each compound selected to simulate. Therefore, we upload the following csv table. Note that the table must have the following exact format.

A csv file with bioactivity data for all eight chemicals. All values were calculated as the 5th percentile of AC50s (active calls only) for each compound, where the list of AC50s was taken from the cHTS assay database from ICE.

ChemicalName	CAS	BioactiveConcentration
Acetamiprid	135410-20-7	7.35400
2,4-db	94-82-6	13.46000
Acephate	30560-19-1	0.05875
Acetochlor	34256-82-1	1.34800
Alachlor	15972-60-8	1.61700
Aldicarb	116-06-3	0.09300
Ametryn	834-12-8	1.08200
Amitraz	33089-61-1	27.49000

The third spot to upload a CSV file is for chemical exposure estimates, which is optional. Uploading this data will allow the user to visualize these exposure estimates against the model-outputted OEDs as well as a

generate bioactivity exposure ratios, which can guide chemical prioritization for potential risk. Suppose we have the following exposure data file:

A csv file with exposure data (mg/kg BW/day) for all eight chemicals. These exposure estimates were gathered from the EPA CompTox Dashboard. NHANES estimates were used if available. Otherwise, the EPA's SEEM3 model predictions were used.

ChemicalName	CAS	Upper	Median	Lower
Acetamiprid	135410-20-7	2.39e-04	5.99e-07	NA
2,4-db	94-82-6	1.29e-04	1.31e-06	NA
Acephate	30560-19-1	1.40e-06	3.37e-07	4.79e-08
Acetochlor	34256-82-1	2.00e-07	4.93e-08	4.74e-09
Alachlor	15972-60-8	1.40e-06	2.7e-07	NA
Aldicarb	116-06-3	2.39e-03	3.03e-06	NA
Ametryn	834-12-8	1.43e-03	2.23e-06	NA
Amitraz	33089-61-1	9.77e-04	1.24e-06	NA

For help with exposure file formatting, please refer to the *Introduction to ToCS* vignette and/or the *Exposure Data File Folder* under the left-side *Instructions* card on the interface. Following the selection of the compounds to simulate as well as uploading bioactivity and exposure data files, the completed *Compound Selection* page should look like the image below.

Toxicokinetic Chemical Simulator (ToCS)

PRELOADED COMPOUNDS

to be applied. See the 'IVIVE Simulation Examples' vignette for the description of the below assumption categories.

Honda1

Select the types of compounds you want to simulate.

Choose from all available chemicals

Enter the volume fraction of fetal bovine serum used in the in vitro assay.

0.1

Select any preloaded compounds. Search through the list by clicking on the box and scrolling or typing in a name. The list may not show all available compounds. Click on a compound to select it. You may select multiple.

94-82-6, 2,4-db
30560-19-1, Acephate
135410-20-7, Acetamidrid
34256-82-1, Acetochlor
15972-60-8, Alachlor
116-06-3, Aldicarb
834-12-8, Ametryn
33089-61-1, Amitraz

UPLOADED DATA

Upload a CSV file of physical and chemical data for compounds not in the preloaded list (if desired). Download the 'Uploaded Physical-Chemical Data File Folder' under the 'Instructions' card for file formatting instructions.

Browse... No file selected

Upload a CSV file with in vitro bioactive concentrations (uM units) for all selected compounds. Download the 'Bioactivity Data File Folder' under the 'Instructions' card for file formatting instructions.

Browse... SampleBioData_8Che

Upload complete

Upload a CSV file of exposure data for all selected compounds (optional). Download the 'Exposure Data File Folder' under the 'Instructions' card for file formatting instructions.

Browse... No file selected

The completed compound selection tab for example 1.

Advanced (Optional) Parameters Tab

We will leave all options on this tab at their default values and proceed to the final *Run Simulation* tab. The *Advanced Parameters* tab should look like the image below.

Toxicokinetic Chemical Simulator (ToCS)
General Parameters
Model Specifications
Compound Selection
Advanced (Optional) Parameters
Run Simulation

MODEL CONDITIONS

Enter the number of Monte Carlo samples generated for each compound.

1000

Enter the minimum acceptable chemical fraction unbound in presence of plasma proteins. All values below this will be set to this value.

0.0001

Select whether to adjust the chemical fraction unbound in presence of plasma proteins for lipid binding.

Yes, adjust the fraction of unbound plasma (default)

Select whether to use regressions when calculating partition coefficients.

Use regressions (default)

MODEL SOLVER

No options for this category.

BIOAVAILABILITY

Enter a default value for the Caco-2 apical-to-basal membrane permeability (denoted Caco2.Pab, 10^{-6} cm/s).

1.6

Select whether to use the Caco2.Pab value set above to estimate F_{abs} (the in vivo measured fraction of an oral dose absorbed from the gut lumen into the gut) if bioavailability data is unavailable.

Use the Caco2.Pab value selected above (default)

Select whether to use the Caco2.Pab value set above to calculate F_{gut} (the in vivo measured fraction of an oral dose that passes gut metabolism and clearance) if bioavailability data is unavailable.

Use the Caco2.Pab value selected above (default)

Select whether to overwrite in vivo F_{abs} and F_{gut} data (if available).

Do not overwrite in vivo values (default)

OUTPUT SPECIFICATION

Select the dose output units from either mg/kg BW/day (mgpkpday) (default) or umol/kg BW/day (umolpkpday).

mgpkpday

The completed advanced parameters tab for example 1.

Run Simulation Tab

Now that all user parameter selections have been made and all compounds appear under the *Select Compounds* card, we click the *Run Simulation* button. Once the simulation is complete, the user's interface should look like the image below. The first tab shows a table of the OED for each compound. The table is available for download by the user if the user clicks the *Download Table 1* button. The user is also able to download all of the simulation parameters and chemical information used in the simulation by clicking the *Download OED Simulation Parameters* tab.

The screenshot displays the 'Run Simulation' tab of the Toxicokinetic Chemical Simulator (ToCS). The interface is divided into three main sections: ACTIONS, SELECTED COMPOUNDS, and RESULTS.

ACTIONS: Contains a 'Run Simulation' button and a 'Reset Session' button. A note indicates that clicking 'Run Simulation' will clear all selections and any uploaded data, and is recommended to be done every time a new simulation is run. A checkbox labeled 'Check the box to display plots with a log10 scale y-axis.' is also present.

SELECTED COMPOUNDS: Lists the compounds selected for simulation: 2,4-db, Acephate, Acetamiprid, Acetochlor, Alachlor, Aldicarb, Ametryn, and Amitraz.

RESULTS: Displays the 'Oral Equivalent Dose Table'. It includes a search bar and two download buttons: 'Download Table 1' and 'Download OED Simulation Parameters'. The table shows 8 entries, with columns for CompoundName, CAS, and OED. The OED values are listed in ascending order.

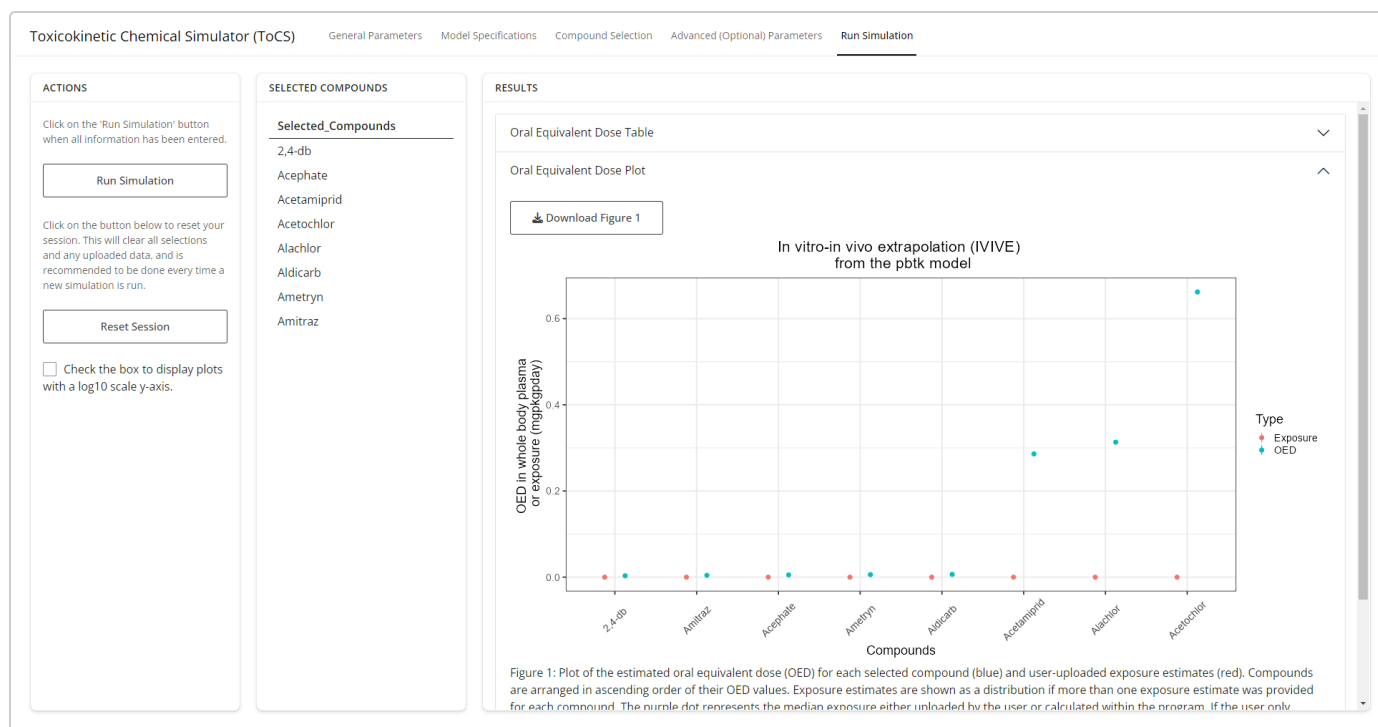

CompoundName	CAS	OED
1 2,4-db	94-82-6	0.003257
2 Acephate	30560-19-1	0.005198
3 Acetamiprid	135410-20-7	0.286
4 Acetochlor	34256-82-1	0.6619
5 Alachlor	15972-60-8	0.3133
6 Aldicarb	116-06-3	0.006453
7 Ametryn	834-12-8	0.005937
8 Amitraz	33089-61-1	0.004169

Showing 1 to 8 of 8 entries. Table 1: Table of the IVIVE oral equivalent doses (OED) (mg/kg/day) for each selected compound. Navigation buttons: Previous, 1, Next.

Below the table, there are two expandable sections: 'Oral Equivalent Dose Plot' and 'Bioactivity Exposure Ratio Table'.

The completed run simulation tab for example 1 showing the expanded OED table tab.

The image below is the completed OED plot tab, which shows the OED (in blue) for the selected quantile for each compound plotted in ascending order. The plot also shows the exposure data estimates (in pink) from the uploaded exposure data file next to each respective chemical so users can compare the oral equivalent dose needed for bioactivity and the exposure estimate. The plot shown below uses a linear y-axis, but as we can see, this makes it challenging to visually see the difference between the smaller OEDs as well as the distribution for the exposure estimates.

The completed run simulation tab for example 1 showing the expanded OED plot tab where the plot has a linear scale y-axis.

Therefore, we can click the box under the *Actions* card to change the scale of the y-axis to a log10 scale. That then results in the image shown below, which allows the user to view the differences in magnitudes of all OEDs and exposure estimates. Two chemicals have three exposure estimates available (lower, median, and upper), which is clearly seen by the median pink dot with bars extending in both directions, while the remaining chemicals only have two exposure estimates uploaded (median and upper). Those chemicals show a pink dot which represents the median exposure and one bar which reaches the upper exposure limit. The user can download either the linear or log10 scale plot by clicking the *Download Figure 1* button.

The completed run simulation tab for example 1 showing the expanded OED plot tab where the plot has a log10 scale y-axis.

The image below shows the bioactivity exposure ratio (BER) table output for the calculated OEDs and uploaded exposure estimates. This is computed as the OED divided by the upper exposure estimate. As with Table 1, users can download this table by clicking the “Download Table 2” button.

Toxicokinetic Chemical Simulator (ToCS) General Parameters Model Specifications Compound Selection Advanced (Optional) Parameters **Run Simulation**

ACTIONS

Click on the 'Run Simulation' button when all information has been entered.

Run Simulation

Click on the button below to reset your session. This will clear all selections and any uploaded data, and is recommended to be done every time a new simulation is run.

Reset Session

☐ Check the box to display plots with a log10 scale y-axis.

Showing 1 to 8 of 8 entries

Table 2: Table of the bioactivity exposure ratio (BER) for each selected compound.

Previous 1 Next

The completed run simulation tab for example 1 showing the expanded bioactivity exposure ratio (BER) table tab.

The final output for the IVIVE module is given below and shows a plot of the BER for each chemical. The red dotted line on the plot indicates the threshold for chemical prioritization (BER = 1), where any chemicals that fall below that threshold should be prioritized for further assessment. In this simulation though, all BERs are greater than one. As with the previous plot, the user has the opportunity to download this plot by clicking the “Download Figure 2” button above the plot.

The completed run simulation tab for example 1 showing the expanded BER plot tab where the plot has a log10 scale y-axis.

If we wanted to run another simulation, we would click the *Reset Session* button under the *Actions* button, which would clear all parameter inputs and simulations and return the interface to the *General Parameters* tab.

Example 2

Let's say we want to perform human IVIVE for ten chemicals that we have bioactivity data for. Assume that we want to use the nominal plasma in vitro bioactivity data as the bioactive concentration instead of the free concentration in vitro, and we want to use restrictive clearance. When the solution is outputted, suppose that we want to view all generated plasma OED samples calculated from the 3compartmentss model. Also suppose that we have chemical exposure estimates for all ten chemicals and would like to use them for this analysis.

General Parameters Tab

Since we want to perform IVIVE, we select the *In vitro in vivo extrapolation (IVIVE)* option under the drop down menu from the *Output* card. Then under the *Species* card, we select *Human* for the first drop down. Thus, the completed *General Parameters* tab should look like the image below.

The screenshot shows the 'General Parameters' tab of the Toxicokinetic Chemical Simulator (ToCS). The interface is divided into three main sections: INSTRUCTIONS, OUTPUT, and SPECIES.

INSTRUCTIONS: This section contains text explaining the simulation process and the four types of toxicokinetic (TK) outputs: 1) Concentration-time profiles, 2) Steady state (SS) concentrations, 3) In vitro in vivo extrapolation (IVIVE), and 4) Parameter calculations. It also provides links to the U.S. EPA's R package 'httk' and additional guidance on ToCS.

OUTPUT: This section has a dropdown menu labeled 'Select the desired output.' with the option 'In vitro in vivo extrapolation (IVIVE)' selected.

SPECIES: This section has a dropdown menu labeled 'Select the species to analyze.' with the option 'Human' selected.

The completed General Parameters tab for example 2.

Model Specifications Tab

Under the *Dosing* card, there are no options to select from. Under the *Model* card, we select *3compartmentss* for the first drop down. For the second drop down, we select *Yes* and decide to make compounds with only in silico generated parameters (hepatic clearance, fraction unbound in plasma) also available for this example. Then, the third drop down menu asks the user whether they want to return a single OED per compound (a selected quantile) or all OED samples per compound. Since we want to output all generated OED samples, we select *Return all OED samples (will also return the 5th dose quantile)*. Thus, the completed *Model Specifications* tab should look like the two images below.

Toxicokinetic Chemical Simulator (ToCS)
General Parameters
Model Specifications
Compound Selection
Advanced (Optional) Parameters
Run Simulation

DOSING
No options for this category.

MODEL
Select the model to simulate. If a species other than 'Human' is selected, '3compartments' must be chosen.
3compartments
Select whether to use in silico generated parameters for compounds with missing in vitro data. These parameters will not overwrite existing in vitro data, and it will expand the number of compounds available.
Yes, load in silico parameters
Select whether to return all oral equivalent dose (OED) samples for each compound or a selected quantile.
Return all OED samples (will also return the 5th dose quantile)

The completed model specifications tab for example 2.

Compound Selection Tab

As with the first example, the first drop down menu under the *Preloaded Compounds* card has the user select a set of simulations assumptions to implement. See example 1 above for descriptions of the assumptions. Since we want to use the nominal concentration in vitro as bioactive and restrictive clearance (protein binding taking into account in liver clearance), we select NULL for the first drop down menu (note that we could have also selected Honda3 for the same result). We keep the second drop menu in the *Preloaded Compounds* card on *Choose from all available chemicals* and then the box below contains a list of preloaded compounds that we can select from. We search for the ten compounds we want to simulate and see that they are all present in the preloaded list. Thus, we select those compounds. Under the *Uploaded Data* card, we ignore the first file selection option since all compounds to simulate were found in the preloaded compounds list. Then for the second file selection option, we are required to upload a CSV file with bioactivity data in it for each selected compound. Therefore, we upload the following csv table. The csv file must have the exact format as the table below.

A csv file with bioactivity data for all ten chemicals. All values were calculated as the 5th percentile of AC50s (active calls only) for each compound, where the list of AC50s was taken from the cHTS assay database from ICE. Abamectin did not have any AC50s, so one was entered to fill the data set.

ChemicalName	CAS	BioactiveConcentration
Acetamiprid	135410-20-7	7.35400

ChemicalName	CAS	BioactiveConcentration
2,4-db	94-82-6	13.46000
Acephate	30560-19-1	0.05875
Abamectin	71751-41-2	1.00000
Acetochlor	34256-82-1	1.34800
Alachlor	15972-60-8	1.61700
Aldicarb	116-06-3	0.09300
Ametryn	834-12-8	1.08200
Amitraz	33089-61-1	27.49000
Atrazine	1912-24-9	1.30200

For formatting instructions, please either download the *Bioactivity Data File Folder* on the left side of the page or consult the *Introduction to ToCS* vignette. The final file upload option under the *Uploaded Data* card provides the user the opportunity to upload chemical exposure data. Thus, we upload the following CSV file:

A csv file with exposure estimate data (mg/kg BW/day) for all ten chemicals. These exposure estimates were gathered from the EPA CompTox Dashboard. NHANES estimates were used if available. Otherwise, the EPA's SEEM3 and SEEM2 model predictions were used.

ChemicalName	CAS	Upper	Median	Lower
Acetamiprid	135410-20-7	2.39e-04	5.99e-07	NA
2,4-db	94-82-6	1.29e-04	1.31e-06	NA
Acephate	30560-19-1	1.40e-06	3.37e-07	4.79e-08
Acetochlor	34256-82-1	2.00e-07	4.93e-08	4.74e-09
Alachlor	15972-60-8	1.40e-06	2.7e-07	NA
Aldicarb	116-06-3	2.39e-03	3.03e-06	NA
Ametryn	834-12-8	1.43e-03	2.23e-06	NA
Amitraz	33089-61-1	9.77e-04	1.24e-06	NA
Abamectin	71751-41-2	1.24e-05	4.17e-08	NA
Atrazine	1912-24-9	4.00e-07	5.76e-08	2.81e-09

For more details on the format of this file, please review the *Introduction to ToCS* vignette and/or the Exposure Data File Folder below the upload area in the interface. The completed *Compound Selection* tab should look like the images below.

The completed compound selection tab for example 2.

Advanced (Optional) Parameters Tab

To speed up the computation time of the program, let's change the number of Monte Carlo samples generated for each compound (under the *Model Conditions* card) from 1000 to 500. Also, since we want to output the plasma OED, we keep the second drop down menu as *plasma*. Thus, the completed *Advanced Parameters* tab should look like the image below.

Toxicokinetic Chemical Simulator (ToCS)
General Parameters
Model Specifications
Compound Selection
Advanced (Optional) Parameters
Run Simulation

MODEL CONDITIONS
Enter the number of Monte Carlo samples generated for each compound.
500
Select which chemical concentration is treated as bioactive in vivo.
Total chemical concentration (default)
Enter the minimum acceptable chemical fraction unbound in presence of plasma proteins. All values below this will be set to this value.
0.0001
Select whether protein binding is taken into account in liver clearance.
Yes, include protein binding (default)
Select whether to adjust the chemical fraction unbound in presence of plasma proteins for lipid binding.
Yes, adjust the fraction of unbound plasma (default)
Select whether to use regressions when

MODEL SOLVER
No options for this category.

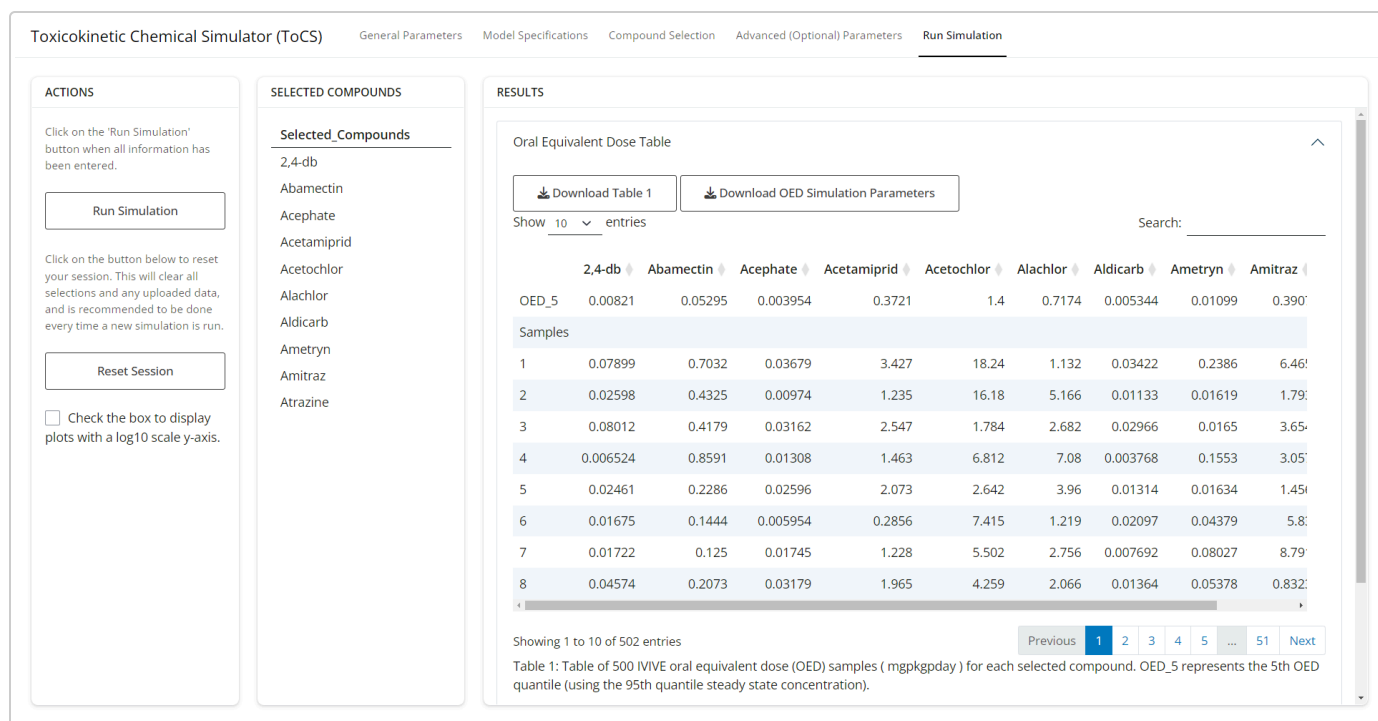

BIOAVAILABILITY
Enter a default value for the Caco-2 apical-to-basal membrane permeability (denoted Caco2.Pab, 10⁻⁶ cm/s).
1.6
Select whether to use the Caco2.Pab value set above to estimate F_{abs} (the in vivo measured fraction of an oral dose absorbed from the gut lumen into the gut) if bioavailability data is unavailable.
Use the Caco2.Pab value selected above (default)
Select whether to use the Caco2.Pab value set above to calculate F_{gut} (the in vivo measured fraction of an oral dose that passes gut metabolism and clearance) if bioavailability data is unavailable.
Use the Caco2.Pab value selected above (default)
Select whether to overwrite in vivo F_{abs} and F_{gut} data (if available).
Do not overwrite in vivo values

OUTPUT SPECIFICATION
Select the dose output units from either mg/kg BW/day (mgpkgsday) (default) or umol/kg BW/day (umolpkgsday).
mgpkgsday
Select the output concentration type. Selecting 'Tissue' for the 3compartmentss model will return the whole body plasma concentration.
plasma

The completed advanced parameters tab for example 2.

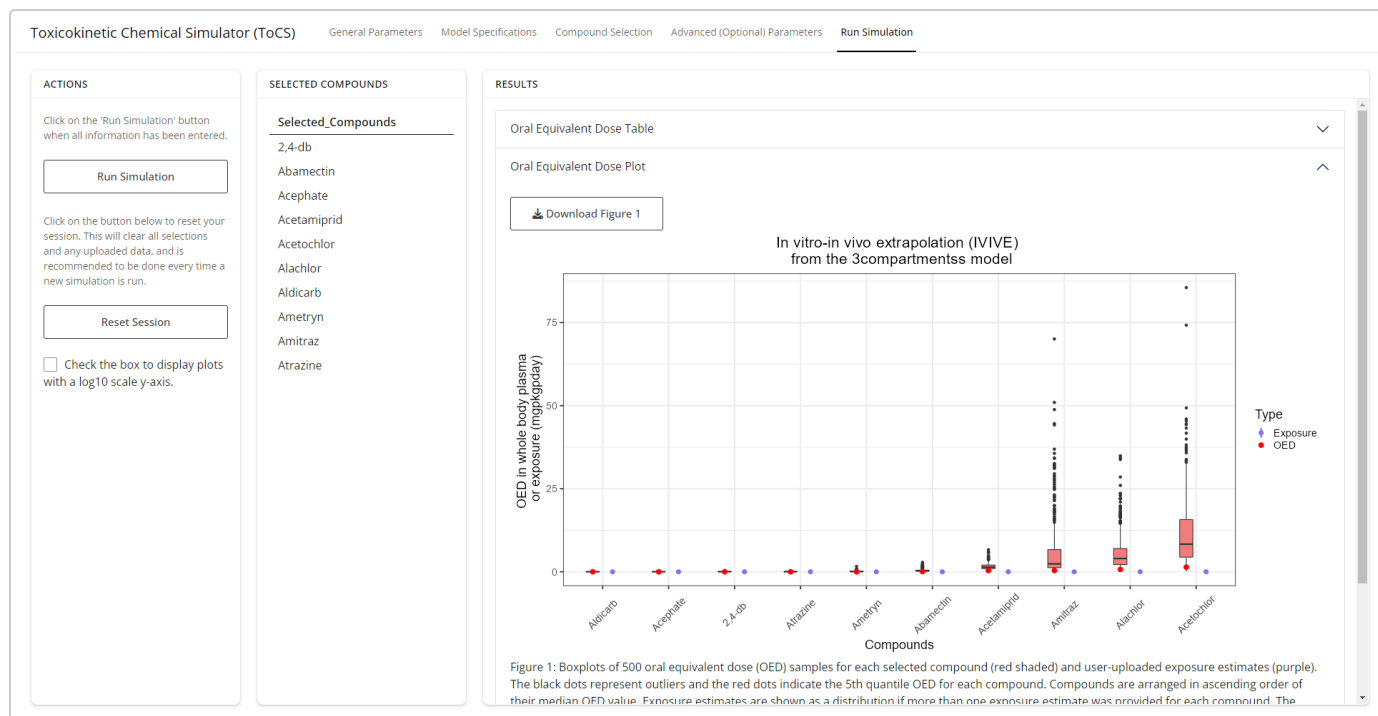

Run Simulation Tab

Now that all user parameter selections have been made and all compounds appear under the *Select Compounds* card, we click the *Run Simulation* button. Once the simulation is complete, the user's interface should look like the image below. The first tab shows a table of all generated OEDs for each compound (based on different steady state concentrations obtained from Monte Carlo simulations). The first row of the table contains the 5th quantile plasma OED, and then the rows below indicate the sample number and corresponding plasma OED from that sample. The user can view the various pages of samples by clicking the *Next* button at the bottom of the table. The table is available for download by the user if the user clicks the *Download Table 1* button. The user is also able to download all of the simulation parameters and chemical information used in the simulation by clicking the *Download OED Simulation Parameters* tab.

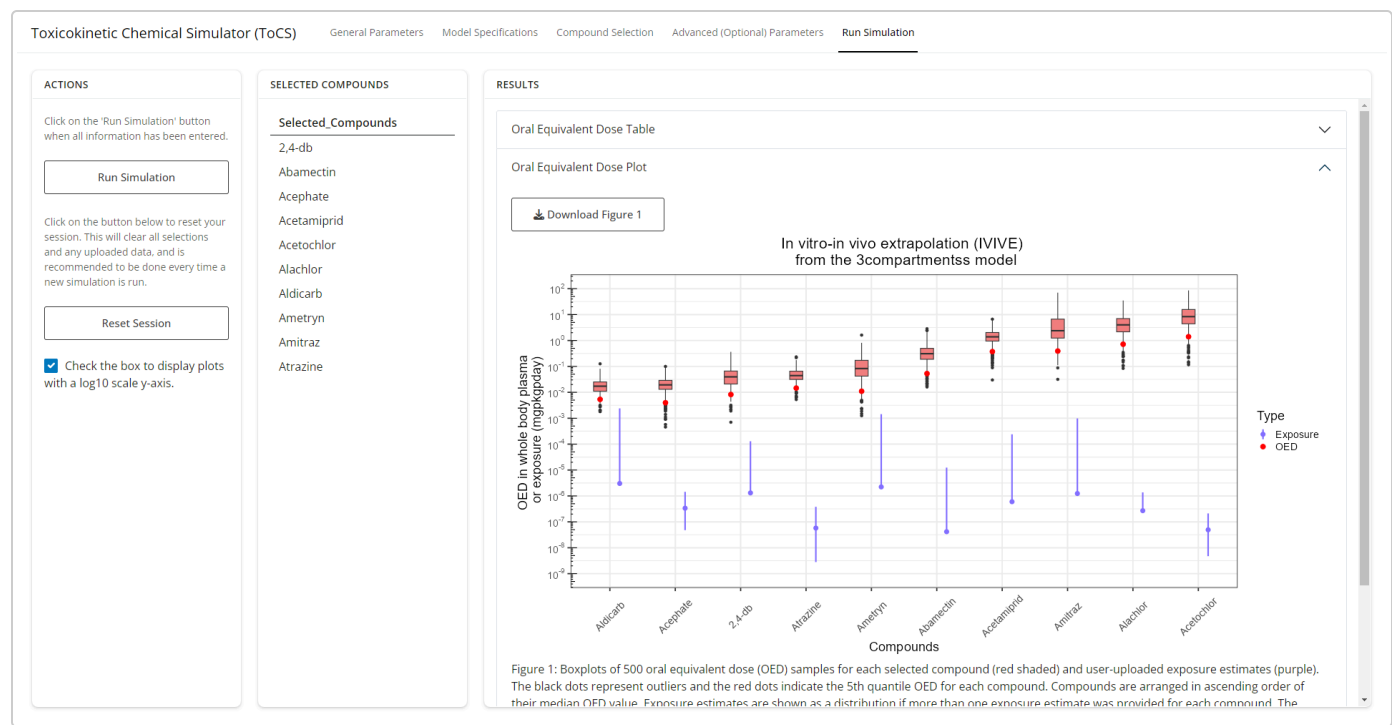

The completed run simulation tab for example 2 showing the expanded OED table tab.

The image below is the completed OED plot tab, which shows boxplots describing the distribution of all OED samples for each simulated compound with line ranges of exposure estimate distributions (in purple) next to each chemical (though they look like singular points due to the linear y-axis). The black dots are outlying samples, and the large red dots represent the 5th quantile OED from the OED table in the previous drop down tab. The plot shown below uses a linear y-axis, but as we can see, this makes it challenging to visually see the distribution of OED samples and all exposure estimates.

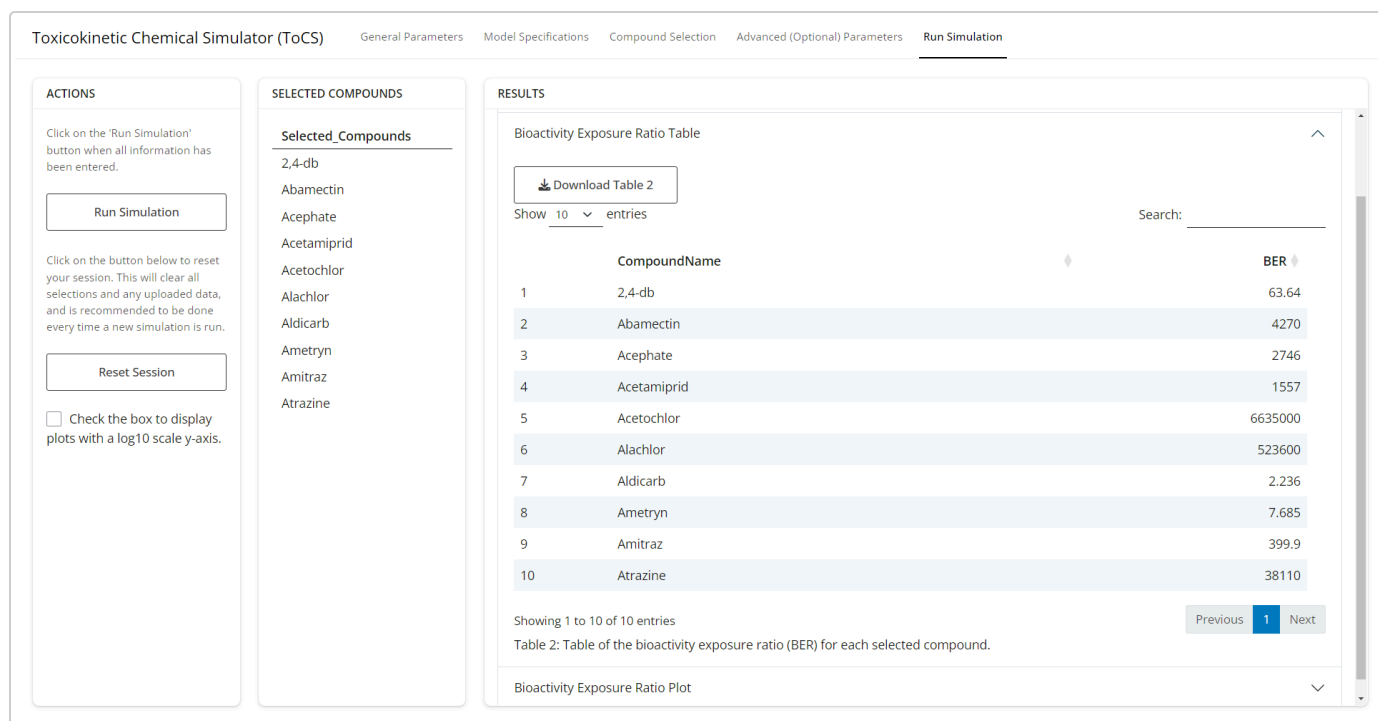

The completed run simulation tab for example 2 showing the expanded OED plot tab where the OED plot has a linear scale y-axis and showcases the OED distributions against the chemical exposure estimate distributions.

Therefore, we can click the box under the *Actions* card to change the scale of the y-axis to a log10 scale. That then results in the image shown below, which allows the user to clearly view and compare the OED sample distributions and exposure estimates of all compounds. The description of the exposure estimates is the same as in example 1. The user can download either the linear or log10 scale plot by clicking the *Download Figure 1* button.

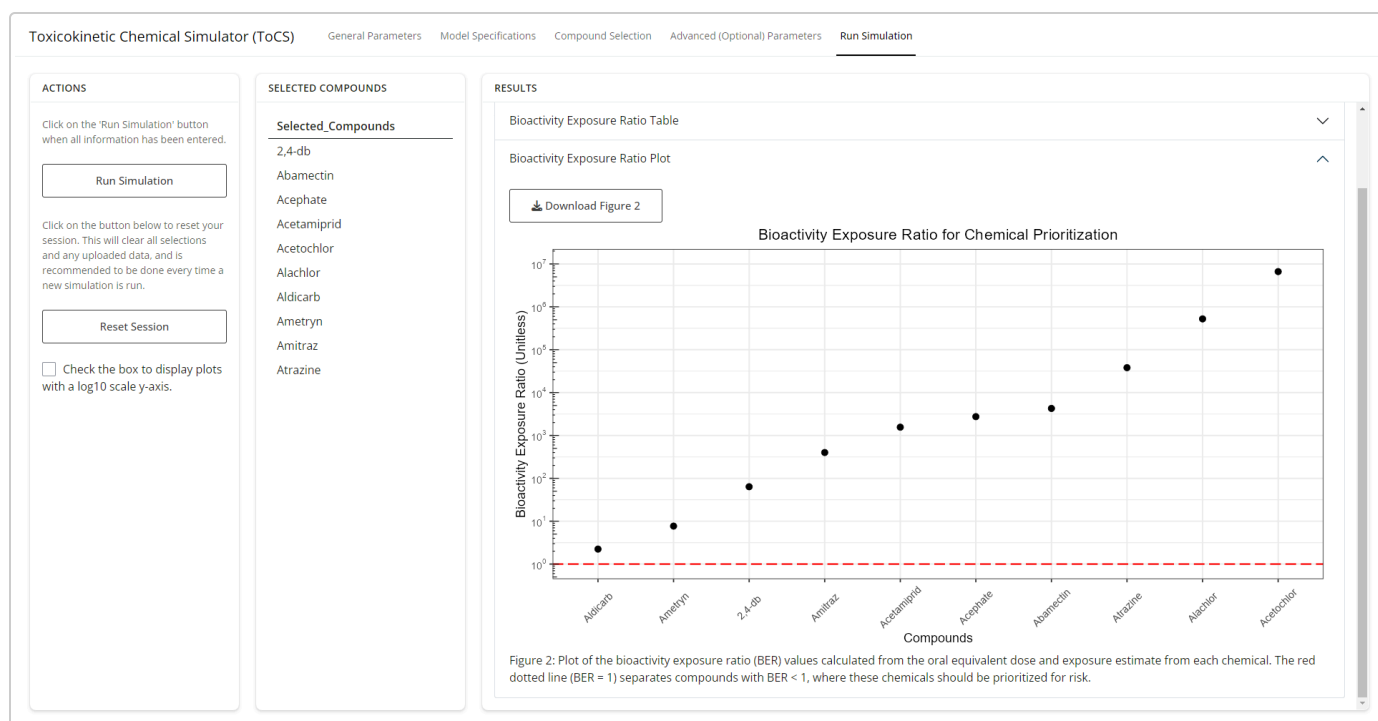

The completed run simulation tab for example 2 showing the expanded OED plot tab where the plot has a log10 scale y-axis.

The table below shows the calculated bioactivity exposure ratios (BERs) for the chemicals included in the simulation with exposure data. The BER was calculated as the quotient of the 5th quantile OED (red dot from the OED plot) and the upper exposure estimate data point. Users can download the table by clicking the *Download Table 2* button above the table.

The completed run simulation tab for example 2 showing the expanded BER table tab.

The image below shows the final output of the IVIVE module which is a plot of the bioactivity exposure ratio (BER) for each chemical. As we can see from the plot, all BERs in this simulation are $\gg 1$ (visually seen by the dotted red line), so they are not considered a risk with the current data used in the simulation. Users can download this plot by clicking the *Download Figure 2* button above the plot.

The completed run simulation tab for example 2 showing the expanded BER plot tab where the plot has a log10 scale y-axis.

If we wanted to run another simulation, we would click the *Reset Session* button under the *Actions* button, which would clear all parameter inputs and simulations and return the interface to the *General Parameters* tab.

Example 3

Let's say that we want to perform human IVIVE to obtain 10th quantile liver OEDs using the 3compartment model. We will use the nominal bioactivity data for the eight compounds used in example 1, and want to include restrictive clearance in the model. We will not upload chemical exposure data for this example.

General Parameters Tab

Since we want to perform IVIVE, we select the *In vitro in vivo extrapolation (IVIVE)* option under the drop down menu from the *Output* card. Then under the *Species* card, we select *Human* for the first drop down. Thus, the completed *General Parameters* tab should look like the image below.

The screenshot shows the 'General Parameters' tab of the Toxicokinetic Chemical Simulator (ToCS). The interface is divided into three main sections: INSTRUCTIONS, OUTPUT, and SPECIES. The INSTRUCTIONS section contains text about the four toxicokinetic (TK) outputs: 1) Concentration-time profiles, 2) Steady state (SS) concentrations, 3) In vitro in vivo extrapolation (IVIVE), and 4) Parameter calculations. It also mentions the application uses the U.S. EPA's R package 'httk' and provides links for more information and reporting issues. The OUTPUT section has a dropdown menu labeled 'Select the desired output.' with 'In vitro in vivo extrapolation (IVIVE)' selected. The SPECIES section has a dropdown menu labeled 'Select the species to analyze.' with 'Human' selected.

Toxicokinetic Chemical Simulator (ToCS)

General Parameters | Model Specifications | Compound Selection | Advanced (Optional) Parameters | Run Simulation

INSTRUCTIONS

Fill out the prompts on each of the above tabs moving left to right. Then, click the 'Run Simulation' tab to run the simulation or reset all selections.

ToCS provides four toxicokinetic (TK) outputs: 1) Concentration-time profiles, which returns chemical concentrations in bodily compartments over time, 2) Steady state (SS) concentrations, which returns SS concentrations in bodily compartments from an oral infusion, 3) In vitro in vivo extrapolation (IVIVE), which returns oral equivalent doses to in vitro bioactive concentrations, 4) Parameter calculations, which returns elimination rates, volumes of distribution, tissue to unbound plasma partition coefficients, half-lives, and total plasma clearances.

This application uses the U.S. EPA's R package 'httk'. For more information on 'httk', refer to <https://doi.org/10.18637/jss.v079.i04> and/or <https://cran.r-project.org/web/packages/httk>

For additional guidance on ToCS, please refer to the vignettes (<https://github.com/KristenWindoloski/ToCS/tree/main/vignettes>). To report issues or suggestions for improvement, visit <https://github.com/KristenWindoloski/ToCS/issues>.

OUTPUT

Select the desired output.

In vitro in vivo extrapolation (IVIVE) ▼

SPECIES

Select the species to analyze.

Human ▼

The completed General Parameters tab for example 3.

Model Specifications Tab

Under the *Dosing* card, there are no options to select from. Under the *Model* card, we select *3compartment* for the first drop down. For the second drop down, we select *No* and decide to make compounds with only in vitro data available for this example. Then, the third drop down menu asks the user whether they want to return a single OED per compound (a selected quantile) or all OED samples per compound. Since we want to output

the 10th quantile OED, we select *Only return a specified dose quantile (default)*. This results in the appearance of another input box. In this final box under the *Model* card, we enter the steady state concentration quantile that we desire to use in our OED calculation (0.90). This will return the 10th quantile OED in the simulation results. Thus, the completed *Model Specifications* tab should look like the two images below.

The screenshot shows the 'Model Specifications' tab in the Toxicokinetic Chemical Simulator (ToCS). The interface is divided into two main sections: 'DOSING' and 'MODEL'. The 'DOSING' section on the left is empty, displaying the message 'No options for this category.' The 'MODEL' section on the right contains several configuration options. It starts with a dropdown menu for 'Select the model to simulate', currently set to '3compartment'. Below this is a dropdown for 'Select whether to use in silico generated parameters for compounds with missing in vitro data', set to 'No, do not load in silico parameters'. The next dropdown is 'Select whether to return all oral equivalent dose (OED) samples for each compound or a selected quantile', set to 'Only return a specified dose quantile (default)'. This dropdown has triggered the appearance of a text input field for 'Enter the steady state concentration quantile (as a decimal) to be used in the OED calculation', which contains the value '0.9'.

The completed model specifications tab for example 3.

Compound Selection Tab

As with the first example, the first drop down menu under the *Preloaded Compounds* card has the user select a set of simulations assumptions to implement. See example 1 for descriptions of the assumptions. As with example 2, we will select NULL for the first drop down menu since we wanted to use 1) the nominal in vitro concentration as bioactive, 2) restrictive clearance, and 3) liver tissue as bioactive in vivo. We keep the second drop menu in the *Preloaded Compounds* card on *Choose from all available chemicals* and then in the box below that, there's a list of preloaded compounds that we can select from. We search for the eight compounds that we want to select and see that they are all present in the preloaded list. Thus, we select those compounds. Under the *Uploaded Data* card, we ignore the first file upload option since all of the compounds we want to simulate are available under the preloaded list in the middle column. The second file upload for bioactivity data is required, and so we upload the following csv table of bioactive concentrations for all compounds:

A csv file with bioactivity data for all eight chemicals. All values were calculated as the 5th percentile of AC50s (active calls only) for each compound, where the list of

AC50s was taken from the cHTS assay database from ICE.

ChemicalName	CAS	BioactiveConcentration
Acetamiprid	135410-20-7	7.35400
2,4-db	94-82-6	13.46000
Acephate	30560-19-1	0.05875
Acetochlor	34256-82-1	1.34800
Alachlor	15972-60-8	1.61700
Aldicarb	116-06-3	0.09300
Ametryn	834-12-8	1.08200
Amitraz	33089-61-1	27.49000

For formatting instructions, please either download the *Bioactivity Data File Folder* on the left side of the page or consult the *Introduction to ToCS* vignette. The final file upload option under the *Uploaded Data* card provides the user the opportunity to upload chemical exposure data. However, suppose that we do not have chemical exposure data to upload for this simulation. Therefore, we leave that blank. The completed *Compound Selection* tab should look like the images below.

Toxicokinetic Chemical Simulator (ToCS)

The completed compound selection tab for example 3.

Advanced (Optional) Parameters Tab

Since we want to output the OED in the liver, we select *tissue* under the second drop down menu in the *Output Specification* card specifying the output concentration type. This prompts the appearance of a third drop down menu. We select *liver* from this menu since we want the liver OED. No changes to other parameters on this page should be made for this example. Thus, the completed *Advanced Parameters* tab should look like the image below.

Toxicokinetic Chemical Simulator (ToCS)

General Parameters Model Specifications Compound Selection **Advanced (Optional) Parameters** Run Simulation

MODEL CONDITIONS

Enter the number of Monte Carlo samples generated for each compound.

Enter the minimum acceptable chemical fraction unbound in presence of plasma proteins. All values below this will be set to this value.

Select whether protein binding is taken into account in liver clearance.

Yes, include protein binding (default) ▼

Select whether to adjust the chemical fraction unbound in presence of plasma proteins for lipid binding.

Yes, adjust the fraction of unbound plasma (default) ▼

Select whether to use regressions when calculating partition coefficients.

Use regressions (default) ▼

MODEL SOLVER

No options for this category.

BIOAVAILABILITY

Enter a default value for the Caco-2 apical-to-basal membrane permeability (denoted Caco2.Pab, 10^{-6} cm/s).

Select whether to use the Caco2.Pab value set above to estimate F_{abs} (the in vivo measured fraction of an oral dose absorbed from the gut lumen into the gut) if bioavailability data is unavailable.

Use the Caco2.Pab value selected above (default) ▼

Select whether to use the Caco2.Pab value set above to calculate F_{gut} (the in vivo measured fraction of an oral dose that passes gut metabolism and clearance) if bioavailability data is unavailable.

Use the Caco2.Pab value selected above (default) ▼

Select whether to overwrite in vivo F_{abs} and F_{gut} data (if available).

Do not overwrite in vivo values

OUTPUT SPECIFICATION

Select the dose output units from either mg/kg BW/day (mg/kgpday) (default) or umol/kg BW/day (umol/kgpday).

mg/kgpday ▼

Select the output concentration type. Selecting 'Tissue' for the 3compartmentss model will return the whole body plasma concentration.

tissue ▼

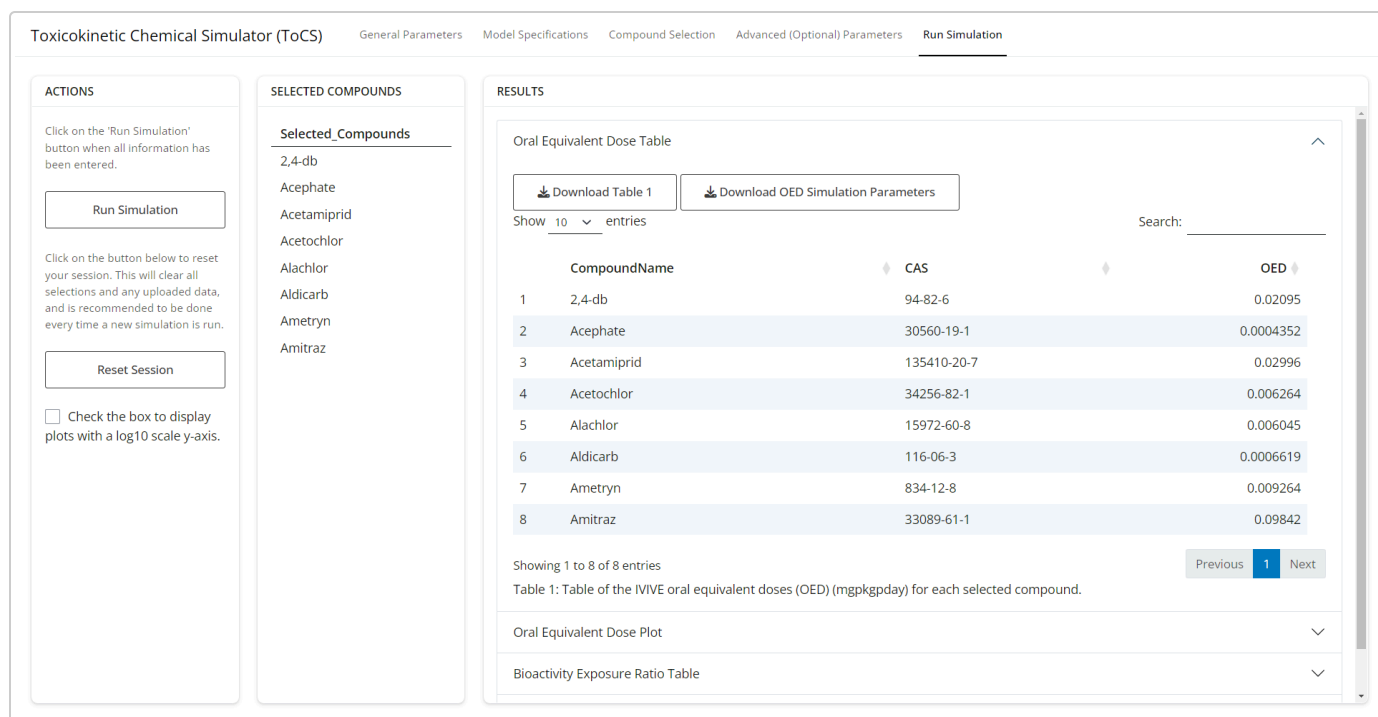

Select a tissue you want the output concentration in. Leave on 'NULL' if the whole body concentration is desired.

liver ▼

The completed advanced parameters tab for example 3.

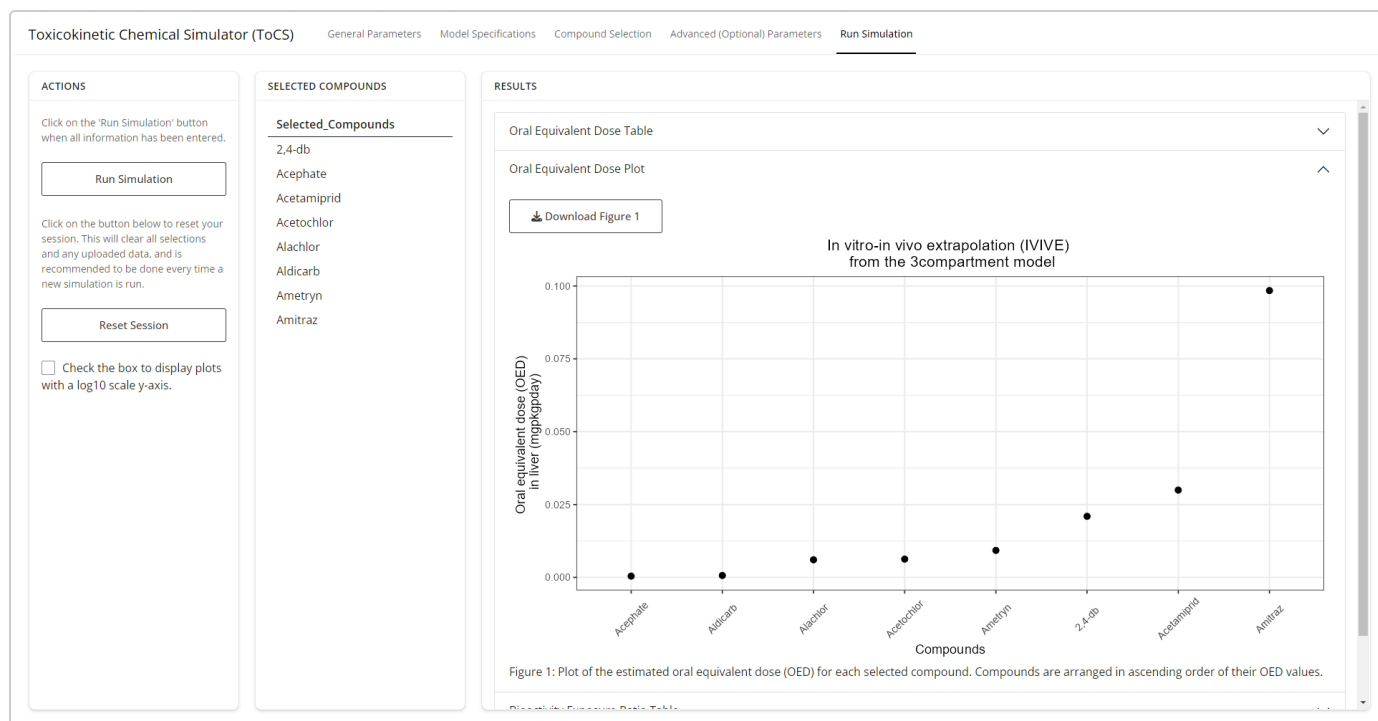

Run Simulation Tab

Now that all user parameter selections have been made and all compounds appear under the *Select Compounds* card, we click the *Run Simulation* button. Once the simulation is complete, the user's interface should look like the image below. The first tab shows a table of the OED for each compound. The table is available for download by the user if the user clicks the *Download Table 1* button. The user is also able to download all of the simulation parameters and chemical information used in the simulation by clicking the *Download OED Simulation Parameters* tab.

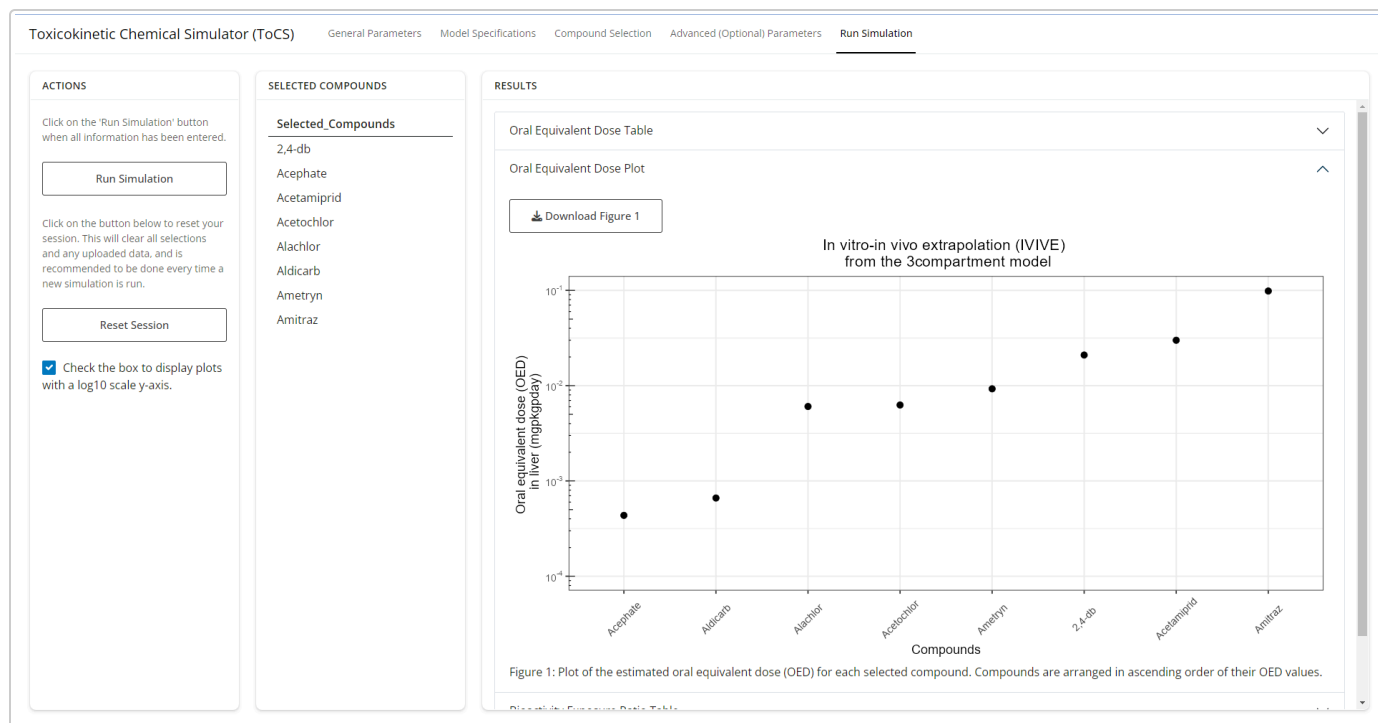

The completed run simulation tab for example 3 showing the expanded OED table tab.

The image below is the completed OED plot tab, which shows a plot of the 10th quantile OEDs using the liver steady state concentration for OED calculation. The plot shown below uses a linear y-axis, but as we can see, this makes it challenging to visually notice the magnitude of smaller OEDs.

The completed run simulation tab for example 3 showing the expanded OED plot tab where the plot has a linear scale y-axis.

Therefore, we can click the box under the *Actions* card to change the scale of the y-axis to a log10 scale. That then results in the image shown below, which allows the user to view the differences in magnitudes of all OEDs. The user can download either the linear or log10 scale plot by clicking the *Download Figure 1* button.

The completed run simulation tab for example 3 showing the expanded OED plot tab where the plot has a log10 scale y-axis.

The final two tabs on the IVIVE module exhibit the bioactivity exposure ratio (BER), if applicable for the simulation. Since no chemical exposure data was uploaded under the *Advanced Parameters* tab, no BERs were calculated for this simulation. If the user wanted to calculate BERs for this simulation, they would need to upload chemical exposure under the previous tab.
